EQUITY RESEARCH MEMORANDUM

Reliance Industries Limited

RELIANCE.NS | NSI | 2026-10-29

LIVE observations | INR crore | NOT RATED

Analysis performed: groq; observed data and numerical calculations remain separate. Selected AI provider: groq.

Executive view

This equity research memorandum covers **Reliance Industries Limited (RELIANCE.NS)** using observed public-market data, available annual financial statements, and the selected source documents. Financial tables use **INR crore**; market prices and per-share values remain in absolute currency units.

Revenue CAGR: 6.39%; EBIT margin: 11.48%; Return on closing equity (proxy): 8.93%; Operating cash flow less capital expenditure: 69,197.00 INR crore

The company remains **NOT RATED**. Source completeness, original-filing reconciliation, and forward assumptions need independent review before forming an investment conclusion.

Research mandate: Review the sourced operating income, beta, terminal dependence and limitations. Explain the scenario without choosing assumptions to match the market quote.

Valuation at a glance

Analytical snapshot	Active model
Observed market price (INR per share)	1,167.40
DCF scenario value (INR per share)	186.43
Model / observed-price difference	-84.03%
Active discount rate	11.21%
Terminal growth	3.00%

Business overview

Reliance Industries Limited engages in hydrocarbon exploration and production, petroleum refining and marketing, petrochemicals, advanced materials and composites, renewable, financial services, retail, and digital services worldwide. It operates through the Oil to Chemicals, Oil and Gas, Retail, Digital Services, and Others segments. The company is involved in refining and marketing products, including liquefied petroleum gas, propylene, naphtha, gasoline, jet/aviation turbine fuel, kerosine oil, diesel, sulfur, and petroleum coke. It also provides polymers comprising high-density and low-density polyethylene (PE), linear low-density PE, homopolymer, random and impact copolymer, and polyvinyl chloride; fiber intermediates that include purified terephthalic acid, and ethylene glycols and oxide; aromatics, such as paraxylene, ortho xylene, benzene, and linear alkyl benzene and paraffin; and textiles that consist of fabrics, apparel, and auto furnishings. In addition, the company offers elastomers, such as polybutadiene rubber, styrene butadiene rubber, and butyl rubber; fiber and yarn polyesters; and bioenergy solutions, including compressed biogas, and pellets and briquettes.

Business description supplied by Yahoo Finance; company filings are the preferred reference for segment detail.

Investment considerations

- **Growth record:** Revenue CAGR over the available comparable history is 6.39%. This is a historical calculation, not a forward growth forecast.
- **Operating economics:** Latest comparable annual EBIT margin is 11.48%. Margin durability requires business-segment and competitive evidence.
- **Cash conversion:** Latest operating cash flow less capital expenditure is 69,197.00 INR crore. This cash-flow proxy differs from the forecast unlevered FCFF used in the DCF.
- **Capital structure:** Latest annual net debt / (cash) is 260,673.00 INR crore. Annual balance-sheet observations and the current share count can have different dates.
- **Investment stance:** NOT RATED. A model output alone is insufficient to establish a price target or a buy/sell recommendation.

Historical financial performance

Financial amounts in **INR crore**. Source observations remain in their original currency; presentation divides amounts by 10,000,000. Prices and per-share values are not scaled. Missing values remain N/A.

Period headers are fiscal period-end dates where supplied by Yahoo. Rows use the same period column; missing values are never replaced with a different year's observation.

Financial metric	2022-03-31	2023-03-31	2024-03-31	2025-03-31	2026-03-31
Revenue	N/A	877,835.00	901,064.00	964,693.00	1,057,219.00

Net debt / (cash) (calculated)	N/A	300,236.00	252,602.00	268,930.00	260,673.00

Operating ratios

Ratios below are calculated from same-period observations. Return on closing equity is a proxy using year-end equity, rather than average equity.

Calculated ratio	2022-03-31	2023-03-31	2024-03-31	2025-03-31	2026-03-31
Revenue growth (YoY)	N/A	N/A	2.65%	7.06%	9.59%
EBITDA margin	N/A	17.46%	19.64%	18.79%	19.38%
EBIT margin	N/A	11.62%	12.39%	11.66%	11.48%
Net profit margin	N/A	7.60%	7.73%	7.22%	7.64%
Return on closing equity (proxy)	N/A	9.32%	8.77%	8.26%	8.93%
Capex / revenue	N/A	16.06%	16.97%	14.51%	11.63%

Key financial observations

Revenue CAGR: 6.39%; EBIT margin: 11.48%; Return on closing equity (proxy): 8.93%; Operating cash flow less capital expenditure: 69,197.00 INR crore

Discounted cash-flow valuation

Five-year operating-company FCFF model. Historical observations anchor the model; growth, margins, reinvestment, tax, discount rates, and terminal growth are explicit assumptions. Valuation is an analytical scenario, not a verified intrinsic value or price target.

Input review status: needs_review. Sourced inputs have not been independently verified or audited.

- Beta source: Historical company beta is estimated from Yahoo Close prices against Nifty 50; corporate-action adjustment quality is not independently verified and the estimate is not forward-looking.
- Beta source: OLS standard error assumes independent, constant-variance residuals; it does not measure all model uncertainty.
- Operating forecasts, terminal ROIC and book-debt/NCI adjustments remain valuation assumptions or proxies requiring review.
- The first forecast assumes a material working-capital cash release as balances move to the selected operating drivers. This is a scenario effect, not a reported cash inflow; verify the opening balances, normalization and interim movements.
- The model relies heavily on the terminal transition or has several nonpositive forecast cash flows. Validate the company's investment cycle, sustainable reinvestment and segment economics before interpreting this scenario.
- The scenario differs materially from the observed quote. Reconcile segment forecasts, reinvestment, non-operating assets and minority claims; the price difference is not proof of valuation accuracy or mispricing.

Valuation date: 2026-10-29. Review annual coverage, quote timing and the dated macro assumptions before interpreting the scenario.

Assumptions and their basis

Driver	Value	Basis / treatment
First forecast revenue growth	6.39%	Recent revenue CAGR between 2023-03-31 and 2026-03-31 (at most three fiscal years); first-year scenario growth, not company guidance.
Fifth forecast revenue growth	3.00%	Fifth-year growth equals the terminal growth scenario by default; growth fades linearly from first-year growth.
EBIT margin	11.66%	Median reported EBIT/revenue from the last three valid comparable annual periods; held constant as a modeling assumption. Observation periods: 2024-03-31, 2025-03-31, 2026-03-31.
Tax rate	23.80%	Median reported tax/positive pretax income from the last three valid comparable annual periods; cash taxes apply only to positive forecast EBIT. Observation periods: 2024-03-31, 2025-03-31, 2026-03-31.
Depreciation / revenue	5.51%	Median reported depreciation/revenue from the last three valid comparable annual periods; held constant. Observation periods: 2024-03-31, 2025-03-31, 2026-03-31.
Capex / revenue	14.51%	Median absolute reported capex/revenue from the last three valid comparable annual periods; held constant during the explicit forecast. Observation periods: 2024-03-31, 2025-03-31, 2026-03-31.
Operating working capital / revenue	0.67%	Median reported working capital rate ratio from 2024-03-31, 2025-03-31, 2026-03-31; held constant as a forecast assumption. Observation periods: 2024-03-31, 2025-03-31, 2026-03-31.
Discount rate (WACC)	11.21%	Active WACC from the linked CAPM/after-tax-debt schedule unless explicitly switched to manual mode.
Terminal growth	3.00%	Explicit illustrative 3% perpetual nominal growth scenario; review against the valuation currency's long-run economic growth.
Terminal return on invested capital (ROIC)	11.21%	Stable return on invested capital is assumed equal to active WACC: a no-excess-return terminal scenario, not an observed company fact.
Net debt / (cash)	260,673.00 INR crore	Reported debt less cash in 2026-03-31; fiscal balances may predate the current quote/share count.
Current shares outstanding	13,532,472,634 shares	Current Yahoo share count; may have a different observation date from annual statements.

Historical operating ratios use the median of the last three valid same-period observations, or the available valid subset. Initial revenue growth uses the recent three-year window's observed CAGR endpoints; it then fades linearly to the fifth-year input. The periods used for each calibration are explicit below.

Calibrated driver	Financial periods used
EBIT margin	2024-03-31, 2025-03-31, 2026-03-31
Tax rate	2024-03-31, 2025-03-31, 2026-03-31
Depreciation / revenue	2024-03-31, 2025-03-31, 2026-03-31
Capex / revenue	2024-03-31, 2025-03-31, 2026-03-31
First forecast revenue growth	2023-03-31, 2026-03-31
Receivable Days	2024-03-31, 2025-03-31, 2026-03-31
Inventory Days	2024-03-31, 2025-03-31, 2026-03-31
Payable Days	2024-03-31, 2025-03-31, 2026-03-31
Cogs Rate	2024-03-31, 2025-03-31, 2026-03-31
Operating working capital / revenue	2024-03-31, 2025-03-31, 2026-03-31

Dated market assumptions

Input	Value	As of	Public source
Risk Free Rate	5.69%	2026-10-28	Source
Sovereign Yield	7.44%	2026-10-28	Source
Equity Risk Premium	6.92%	2026-07-01	Source
Sovereign Default Spread	1.75%	2026-07-01	Source

Cost of capital build

The active discount rate is linked to the WACC schedule in the Excel workbook. Calibration inputs and manual overrides remain visible; an assumed risk-free rate or risk premium is not presented as a current market observation.

WACC component	Input / calculation	Basis
Risk-free rate	5.69%	Currency-consistent modeling input
Equity risk premium	6.92%	Modeling input; review geography and valuation date
Levered beta	1.04	Provider beta estimate or explicit model assumption; review estimation window and leverage
Cost of equity	12.88%	Risk-free rate + beta x equity risk premium
Pre-tax cost of debt	6.04%	Historical interest / closing book debt proxy, dated source input, or explicit assumption
After-tax cost of debt	4.61%	Pre-tax cost of debt x (1 - tax rate)
Debt weight	20.12%	Book debt / (book debt + market equity) proxy; observation dates can differ
Calculated WACC	11.21%	Cost of equity x equity weight + after-tax cost of debt x debt weight
Active discount rate	11.21%	CAPM-derived WACC

Operating working-capital schedule

Operating working capital excludes cash and financing debt. Investment in working capital is the change in the modeled operating balance, not the reported cash-flow statement's working-capital movement.

Operating driver	Active input
Receivable days	15.94
Inventory days	77.44
Payable days	94.34
Cost of revenue / revenue	74.87%

Receivables = revenue x receivable days / 365; inventory and payables = cost of revenue x the corresponding days / 365. Operating balance = receivables + inventory - payables.

Working capital (INR crore)	2027E	2028E	2029E	2030E	2031E
Trade receivables	49,112.48	51,836.03	54,270.78	56,359.40	58,050.18
Inventories	178,672.53	188,580.88	197,438.58	205,037.03	211,188.14
Trade payables	217,657.39	229,727.67	240,518.04	249,774.41	257,267.64
Operating working-capital balance	10,127.61	10,689.24	11,191.32	11,622.02	11,970.68
Investment / (release) in working capital	-56,462.39	561.63	502.08	430.70	348.66

The base balance uses reported same-period components.

Forecast financials

Forecast amounts in **INR crore**; E denotes an estimate. These are calculated assumptions rather than reported financials.

Forecast metric	2027E	2028E	2029E	2030E	2031E
Revenue	1,124,818.15	1,187,195.39	1,242,958.28	1,290,793.69	1,329,517.50
Cost of revenue	842,116.87	888,816.80	930,564.77	966,377.68	995,369.01
Operating profit (EBIT)	131,129.07	138,400.89	144,901.62	150,478.17	154,992.52
After-tax operating profit (NOPAT)	99,922.88	105,464.15	110,417.83	114,667.27	118,107.29
Add: depreciation & amortisation	61,955.81	65,391.60	68,463.06	71,097.87	73,230.80
Less: capital expenditure	163,199.51	172,249.80	180,340.42	187,280.85	192,899.27
Less: investment in working capital	-56,462.39	561.63	502.08	430.70	348.66
Full-year unlevered free cash flow (FCFF)	55,141.57	-1,955.69	-1,961.61	-1,946.41	-1,909.84
FCFF after valuation date	23,114.14	-1,955.69	-1,961.61	-1,946.41	-1,909.84
Present value of FCFF	22,107.81	-1,681.60	-1,516.76	-1,353.38	-1,194.16

FCFF = EBIT - max(EBIT, 0) x tax rate + depreciation - capital expenditure - change in working capital. Negative EBIT receives no automatic cash-tax refund. Full-year operating cash flow is retained in the forecast. The first valuation cash flow includes only the remaining fiscal-year fraction, assuming uniform cash generation; later years use full-year FCFF. Cash flows and terminal value use fiscal year-end dates and actual days / 365.25 from the valuation date.

Valuation timing	2027E	2028E	2029E	2030E	2031E
Revenue growth	6.39%	5.55%	4.70%	3.85%	3.00%
Fiscal cash-flow date	2027-03-31	2028-03-31	2029-03-31	2030-03-31	2031-03-31
Discount period (actual days / 365.25)	0.4189	1.4209	2.4203	3.4196	4.4189
Cash-flow fraction after valuation date	41.92%	100.00%	100.00%	100.00%	100.00%

Terminal operating economics

Terminal reinvestment supports perpetual growth: reinvestment rate = growth / ROIC; terminal FCFF = terminal NOPAT x (1 - reinvestment rate). Default terminal ROIC equals active WACC, explicitly assuming no excess returns. A manual ROIC remains fixed when WACC changes.

Terminal driver	Value
Terminal financial year	2032
Terminal revenue	1,369,403.03
Terminal EBIT	159,642.29
Terminal NOPAT	121,650.51
Terminal growth	3.00%
Terminal ROIC	11.21%
Reinvestment rate	26.76%
Terminal reinvestment	32,551.03
Terminal FCFF	89,099.48
ROIC treatment	roic_equals_wacc

Enterprise-to-equity value bridge

Amounts in **INR crore**, except shares and per-share values.

Valuation component	Calculated amount
PV of explicit forecast FCFF	16,361.91
Terminal value at forecast end (undiscounted)	1,085,034.35
PV of terminal value	678,437.74
Terminal value share of enterprise value	97.65%
Enterprise value	694,799.65
Less: net debt / (cash)	260,673.00
Less: reported non-controlling interests	181,836.00
Equity value	252,290.65
Shares outstanding (absolute shares)	13,532,472,634
Illustrative value per share (INR, absolute)	186.43
Last observed market price (INR, absolute)	1,167.40
Scenario difference versus observed price	-84.03%

Terminal value = terminal NOPAT x (1 - terminal growth / terminal ROIC) / (active WACC - terminal growth), discounted over the final forecast's actual-day period. Enterprise value = PV of forecast FCFF + PV of terminal value. Equity value = enterprise value - net debt - reported non-controlling interests. The reported non-controlling-interest balance is a book-value proxy for the subsidiary ownership claim; its market value may differ materially.

The scenario difference compares a hypothetical valuation with the last available quote. It does not imply forecast price appreciation. The quote may be delayed and may differ in date from annual balance-sheet data.

Sensitivity to discount rate and terminal growth

Calculated value per share in **INR, absolute units**. Rows vary WACC; columns vary terminal growth. Each cell recomputes terminal growth / ROIC reinvestment and terminal FCFF. Default ROIC follows each row's WACC; an explicit ROIC remains fixed. Operating forecasts and the first-year cash-flow fraction are held constant. Unsupported combinations remain N/A.

WACC / terminal growth	1.00%	2.00%	3.00%	4.00%	5.00%
9.21%	333.30	339.72	346.13	352.55	358.97
10.21%	246.77	252.33	257.90	263.46	269.02
11.21%	176.70	181.57	186.43	191.30	196.17
12.21%	118.98	123.27	127.57	131.87	136.16
13.21%	70.76	74.58	78.40	82.22	86.03

Risks and evidence gaps

- **Data and reporting basis:** Aggregator financials can be incomplete, delayed, restated, or mismatched in consolidation basis. Reconcile each fiscal period to the original audited filings.
- **Forecast risk:** Historical growth, margins, and reinvestment ratios do not establish future outcomes. Assess customer concentration, industry conditions, and capital intensity from company-specific disclosures.
- **Valuation sensitivity:** Small changes in WACC, terminal growth, capital spending, or margins can materially change the model output. Net debt and current shares may use different observation dates.
- **Accounting and governance:** No fraud finding, governance score, or assurance opinion is issued. Those conclusions require evidence beyond this data set.
- Yahoo Finance is a secondary source; verify financial statements against company filings.
- Capital expenditure is shown as a positive cash outflow.
- Historical company beta is estimated from Yahoo Close prices against Nifty 50; corporate-action adjustment quality is not independently verified and the estimate is not forward-looking.
- OLS standard error assumes independent, constant-variance residuals; it does not measure all model uncertainty.
- Risk-free input is an adjusted estimate using the disclosed RBI yield and NYU sovereign-spread dates; India ERP is a country proxy and may differ from company exposure.
- Five-year forecasts and the DCF are assumption-driven scenarios, not price targets or audited financial statements.
- Discounting uses fiscal year-end dates and actual days/365.25. First-year FCFF is prorated for the remaining fiscal period assuming uniform cash generation; no foreign-exchange conversion is applied.
- The first forecast year's cash flow is a remaining-period estimate under a uniform cash-generation assumption; interim results and seasonality are not inferred.
- The first forecast assumes a material working-capital cash release as balances move to the selected operating drivers. This is a scenario effect, not a reported cash inflow; verify the opening balances, normalization and interim movements.
- The equity bridge deducts reported book non-controlling interests as a proxy; it is not a separately estimated market value of minority claims.
- The model relies heavily on the terminal transition or has several nonpositive forecast cash flows. Validate the company's investment cycle, sustainable reinvestment and segment economics before interpreting this scenario.
- The scenario differs materially from the observed quote. Reconcile segment forecasts, reinvestment, non-operating assets and minority claims; the price difference is not proof of valuation accuracy or mispricing.

Catalysts and monitorables

No dated company-specific catalyst is asserted without independently classified supporting evidence. The following are research checkpoints, rather than confirmed events or forecasts:

- Obtain the latest results, annual report, auditor notes, and management discussion for the requested company and reporting period.
- Compare subsequent reported revenue, operating margins, working capital, and capital expenditure with the model assumptions.
- Review management guidance, segment disclosures, related-party transactions, debt maturities, and share-count changes where available.
- Revisit valuation after material results, corporate actions, or changes in the evidence base.

Research synthesis

AI commentary provides qualitative interpretation. All monetary amounts and valuation results come from the calculated tables. Interpretations still require review against the underlying sources.

Analyst assessment

The operating-income projection rests on a recent revenue growth path and a median EBIT-margin derived from the last three fiscal years. Because the margin is held constant, any shift in the mix of high-margin petrochemicals versus lower-margin refining or retail could materially alter the forecasted earnings. Capital spending is anchored to a median capex-to-revenue ratio, which assumes the firm will continue to invest at historic levels despite the ongoing transition toward renewable and digital businesses; a change in the investment cycle would affect free-cash-flow generation.

The equity-risk estimate uses a beta calculated from two-year weekly price returns against the Nifty 50. The source is a secondary Yahoo data feed, and the methodology does not adjust for corporate actions or total-return effects. The regression’s modest explanatory power and standard-error warnings highlight that the beta may not capture forward-looking systematic risk, especially given the company’s diversified exposure across energy, retail and technology.

The terminal value is driven by a “no-excess-return” assumption where the long-run ROIC is set equal to the calculated WACC. This forces the terminal growth rate to be the only source of value beyond the explicit forecast horizon, making the valuation highly sensitive to the terminal growth input and to the stability of the ROIC-WACC parity. If the firm’s sustainable returns diverge from the WACC-either higher due to competitive advantages or lower because of capital-intensive segments-the terminal estimate could be materially mis-stated.

Key limitations flagged in the model include: reliance on a working-capital cash release that is scenario-based rather than observed; the heavy weight of the terminal transition given several non-positive forecast cash flows; and the use of book-value non-controlling interest as a proxy for minority claims. Analysts should verify the opening balance-sheet items, test alternative beta constructions, and explore sensitivity to terminal ROIC and growth assumptions before drawing conclusions about intrinsic value.

Attached public documents

Attachments are unverified context. Their company identity, period, reporting basis, and original-filing status have not been certified. They do not automatically replace or reconcile the Yahoo observations used in the financial model.

No original filings were attached.

Provenance and methodology

Public source links omit query parameters and fragments; private file locations are excluded from the published document.

Presentation units: INR crore; divisor 10,000,000. Source values and DCF calculations retain absolute currency units. Display rounding does not change the calculation base. No foreign-exchange conversion is performed.

Historical method: Ratios use corresponding annual fiscal-period columns. CAGR uses available positive revenue observations and their year spacing. Operating cash flow less capex is shown as a cash-flow proxy; it is not the same as the DCF's forecast FCFF. Return on closing equity uses year-end equity rather than average equity.

DCF method: The operating-company model is withheld for banks and other financial institutions, or when required comparable inputs are missing. Forecast values depend on disclosed, editable assumptions. Terminal value uses perpetual growth and year-end discounting. Nonpositive or unsupported valuations are not presented as price targets.

Research scope: This is a personal-research memorandum, not a verified brokerage research opinion, investment recommendation, assurance opinion, or promise of future performance. The company remains NOT RATED. No synthetic company values are substituted in LIVE mode.
